Rainscreen cladding systems typically incorporate a minimum 25mm continuous ventilated air space. The inclusion of this cavity ensures that any rain penetration can drain freely within the façade construction. To accommodate this design feature, together with the essential but conflicting requirement to install cavity fire barriers, Lamatherm have developed a purpose-made solution. The Lamatherm CW-RS system includes products for both horizontal and vertical situations: CW-RS H & CW-RS V.

### Advantages
- Tested utilising the principles of BS 476: Part 20 & BS EN 1366-4:2006
- Provides up to 60 minutes fire integrity and insulation
- Suitable for both Horizontal and Vertical applications
- Provides a hot smoke & fire seal
- Supplies pre-cut in strips to suit specific void dimensions
- Quality assured to BS EN ISO 9001

### Fire Performance

**Lamatherm CW-RSH** has been successfully tested and assessed for up to 60 minutes fire resistance and insulation using the general principles of BS 476: Part 20:1987 and BS EN 1366:2006. When adopting the fire resistance testing procedure of BS 476: Part 20, technical failure of integrity & insulation would be deemed to have occurred at the start of the test due to flame passage through the open end of the test apparatus. However, following the rapid expansion of the intumescent layer, the cavity becomes fully sealed and the product achieves the integrity & insulation criteria.

Test Report: WFR No. 157714 & 154496

CW-RS Cavity Barriers for Rainscreen Cladding

Standards & Approvals

Additionally, they meet in principle the higher minimum fire resistance standard (30/30) for cavity barriers outlined in the LPC Design Guide for the Fire Protection of Buildings.

Lamatherm CW-RS Cavity Barriers may also be used as fire stops to maintain the fire resistance of compartment floors and walls. However, such requirements would be uncommon. Rainscreen claddings are generally external to the structural building envelope. The need to maintain the fire resistance of compartment elements would not normally extend beyond the inner structural wall interface.

Installation CW-RS (Horizontal)

Lamatherm CW-RS is installed within the cavity formed between the rainscreen façade and the inner structural wall, using the appropriate Lamatherm support brackets (see table 2). To prevent fire flanking to the rear of the fire stop, any thermal insulation fitted to the outer face of the structural wall, must be completely cut away to accommodate the thickness of CW-RS product.

The CW-RS is fitted with the plain mineral fibre edge against the structural wall. A 25mm clear cavity void should be left between the front edge of the cavity barrier and the rear surface of the rainscreen façade.

NHBC requires 50mm for open joint, however CWCT clause 3.4.4.4. clearly states that at fire barrier location, the void must not be reduced by more than 50%, therefore 50mm ventilation void can be locally reduced to the optimum of 25mm. Also refer to CWCT TN73 that deals with this topic.

Adjacent lengths of CW-RS should be tightly abutted to prevent gaps. The top surface of the joint should be sealed with Lamatherm RFT 120/45 foil tape.

CW-RS support Brackets:

A range of support brackets for CW-RS horizontal cavity barriers are available for cavity widths of up to 425mm (see table 2 for appropriate type and fixing centres).

Lengths of the barrier are secured with dedicated metal support brackets as detailed under installation.

Our technical section would be pleased to advise in more depth on individual project requirements.

Product Description

General

CW-RS & CW-RSV cavity barriers consist of a non-combustible rock mineral wool lamella core material, reinforced on two faces with a Class ‘O’ rated aluminium foil. The construction offers an excellent resistance to the passage of both smoke and fire.

The exposed leading edge is also sealed with aluminium foil. Whilst the base material is water repellent & non-hydroscopic, this predominantly enclosed arrangement affords an added degree of weather protection to the core material. The barriers are secured with dedicated metal support brackets as detailed under installation.

Horizontal Cavity Barrier

Lamatherm CW–RSH incorporates a continuous bonded intumescent strip to the leading edge and encapsulated in a weather resistant polymer film. In the event of exposure to fire, this expands and forms a full fill barrier system.

Vertical Cavity Barrier

For vertical barriers within rainscreen systems, it is generally acceptable to fully fill the void. Our Lamatherm CW–RSV product is specifically intended for use in this manner. As a full fill barrier system, the integral intumescent strip is not required. The front edge is finished as standard in a plain aluminium foil.

Alternatively, the product is optionally available with a factory applied DPC pre-bonded to this surface.

Notes:

For cut lengths a minimum of 2 brackets per length must be employed.

When using RS 450 and RS 550 brackets for larger voids, pre-fitting the brackets to the product is recommended prior to fixing to the wall.

(1) dimension may alter with specific design criteria
**CW-RS Cavity Barriers for Rainscreen Cladding**

**Installation CW-RSV (Vertical)**

Lamatherm CW-RSV is installed within the cavity formed between the rainscreen façade and the inner structural wall, using the appropriate Lamatherm support brackets (see table 3).

The CW-RSV is fitted vertically under compression, completely filling the void. The product is installed with the plain mineral fibre edge positioned against the structural wall.

To prevent fire flanking to the rear of the fire stop, any thermal insulation fitted to the outer face of the structural wall, must be completely cut away to accommodate the thickness of CW-RSV product.

Adjoining lengths of CW-RSV should be tightly abutted to prevent gaps. Joints should be sealed with Lamatherm RFT 120/45 foil tape.

Courtesy of the unique internal 'lamella' construction, facade deflection can be accommodated, even at the mid position of the panel system.

**CW-RSV support Brackets:**

A range of support brackets for CW-RSV vertical cavity barriers are available for cavity widths of up to 400mm (see table 3 for appropriate type).

Lengths of the barrier are supported with these dedicated brackets, which partially impale the product at mid thickness.

The brackets are supplied as standard in 1mm galvanised mild steel in a flat form for site folding. They incorporate pre-notched indents to aid this process.

The brackets are drilled on site and secured to the inner structural wall using non-combustible steel anchors or screws (see figs 3 & 4).

Brackets are installed at 600mm fixing centres (300mm from each end) and should be trimmed, if necessary, to approximately 75% of the cavity width.

**Note:**

For voids <100mm: measured cavity + 5mm compression is required.

For voids >100mm: measured cavity + 10mm compression is required.

**Dimensions**

1200mm long. Supplied pre-cut in width to suit advised void size.

**Thermal Performance**

Thermal conductivity 0.039W/m.K

**Health & Safety**

Current HSE ‘CHIP’ Regulations and EU directive 97/69/EC confirm the safety of rock mineral wool.

The fibres are not classified as a possible human carcinogen.

A Material Safety Data Sheet is available upon request.

**Technical Advice**

For further information please contact us at the address below.

---

**Ordering**

Lamatherm CW-RS products are manufactured to order on a project basis to suit individual requirements.

*For reasons of normal building tolerances, variations between design dimensions and 'as built' dimensions may occur. We would strongly recommend that actual site dimensions are measured and checked prior to ordering.*

**CW-RS ordering Procedure:**

- Advise project title & location
- Specify required fire rating
- Specify void size / schedule of sizes for each product type
- For each product & size confirm total linear metres required
- Specify bracket type and quantity required
- Specify RFT 120/45 foil tape quantity requirement
